

## Rw25dB soundproof sliding door.

For ordering a Rw25dB sliding door we need to know the height and width of the door opening and the door's hand. NB! The minimum space between the ceiling and the upper edge of the door opening must be at least 150 mm!

In case of a gypsum wall there must be wooden beams inside the wall for attaching the jamb and track:

- In the closing side of the door opening.
- Above the door opening in the full length of the track.

Floor must be level in the door opening area in order for the seals to ensure necessary soundproofness. Maximum width of the sliding door is 1200 mm, which can be used for closing a 1160 mm wide door opening.
